

Finite-State Machines with No Output

Section 13.3

Languages

- A **vocabulary** (or **alphabet**) V is a finite non-empty set of elements called **symbols**.
- A **word** (or **sentence**) over V is a string of finite length of elements of V .
- The **empty string** or **null string**, denoted by λ , is the string containing no symbols.
- The set of all words over V is denoted by V^* .
- A **language** over V is a subset of V^* .

Set of Strings

- The *concatenation* of A and B , where A and B are subsets of V^* , denoted by AB , is the set of all strings of the form xy , where x is a string in A and y is a string in B .
- Let $A = \{0, 11\}$ and $B = \{1, 10, 110\}$. Then
$$AB = \{01, 010, 0110, 111, 110, 11110\}$$
and
$$BA = \{10, 111, 100, 1011, 1100, 11011\}$$

Set of Strings

- If A is a subset of V^* , the *Kleene closure* of A , denoted by A^* , is the set consisting of arbitrarily long strings of elements of A . That is,

$$A^* = \bigcup_{k=0}^{\infty} A^k$$

- The Kleene closures of the sets $A = \{0\}$, $B = \{0,1\}$ and $C = \{11\}$ are

$$A^* = \{0^n \mid n = 0, 1, 2, \dots\}$$

$$B^* = V^*$$

$$C^* = \{1^{2n} \mid n = 0, 1, 2, \dots\}$$

Language Recognition by FSAs

- A string x is said to be *recognized* (or *accepted*) by the machine $M = (S, I, f, s_0, F)$ if it takes the initial state s_0 to a final state, that is, $f(s_0, x)$. The *language recognized* (or *accepted*) by M , denoted by $L(M)$, is the set of all strings that are recognized by M . Two finite-state automata are called *equivalent* if they recognize the same language.

- The only final state of M_1 is s_0 . The strings that take s_0 to itself consist of zero or more consecutive 1s. Hence,

$$L(M_1) = \{1^n \mid n = 0, 1, 2, \dots\}.$$

Language Recognition by FSAs

- The only final state of M_2 is s_2 . The strings that take s_0 to s_2 are 1 and 01. Hence, $L(M_2) = \{1, 01\}$.

- The final state of M_3 are s_0 and s_3 . The strings that take s_0 to itself are $\lambda, 0, 00, 000, \dots$. The strings that take s_0 to s_3 are a string of zero or more consecutive 0s, followed by 10, followed by any string. Hence,
 $L(M_3) = \{0^n, 0^n 10x \mid n = 0, 1, 2, \dots, \text{ and } x \text{ is any string}\}$

Language Recognition by FSAs (*cont.*)

Example: Construct a FSA that recognizes the set of bit strings that begin with two 0s.

Language Recognition by FSAs (*cont.*)

Example: Construct a FSA that recognizes the set of bit strings that begin with two 0s.

NDFSA

- A nondeterministic finite-state automaton

$M = (S, I, f, s_0, F)$ consists of a finite set S of *states*, a finite *input alphabet* I , a *transition function* f that assigns a set of states to every pair of state and input (so that $f: S \times I \rightarrow P(S)$), an *initial* or *start state* s_0 , and a subset F of S consisting of *final* (or *accepting*) states.

TABLE 2

| State | f | |
|-------|-----------------|------------|
| | Input | |
| | 0 | 1 |
| s_0 | s_0, s_1 | s_3 |
| s_1 | s_0 | s_1, s_3 |
| s_2 | | s_0, s_2 |
| s_3 | s_0, s_1, s_2 | s_1 |

Finding an Equivalent DFSA

Example: Find a DFSA that recognizes the same language as the NFSA:

TABLE 3

| State | <i>f</i> | |
|-------|------------|-------|
| | Input | |
| | 0 | 1 |
| s_0 | s_0, s_2 | s_1 |
| s_1 | s_3 | s_4 |
| s_2 | | s_4 |
| s_3 | s_3 | |
| s_4 | s_3 | s_3 |
