

# CS 261 Fall 2019

Mike Lam, Professor

## Arrays and Strings

Please go to [socrative.com](https://socrative.com) on your phone or laptop, choose “Login” then “Student Login” and join room “LAMJMU”

# Arrays and Pointers

- In C, array names are just aliases that can be used as pointers

```
int y[] = {2, 3, 4, 5};    // these two are  
int *y  = {2, 3, 4, 5};    // roughly equivalent
```

- Indexing and dereferencing pointers are equivalent

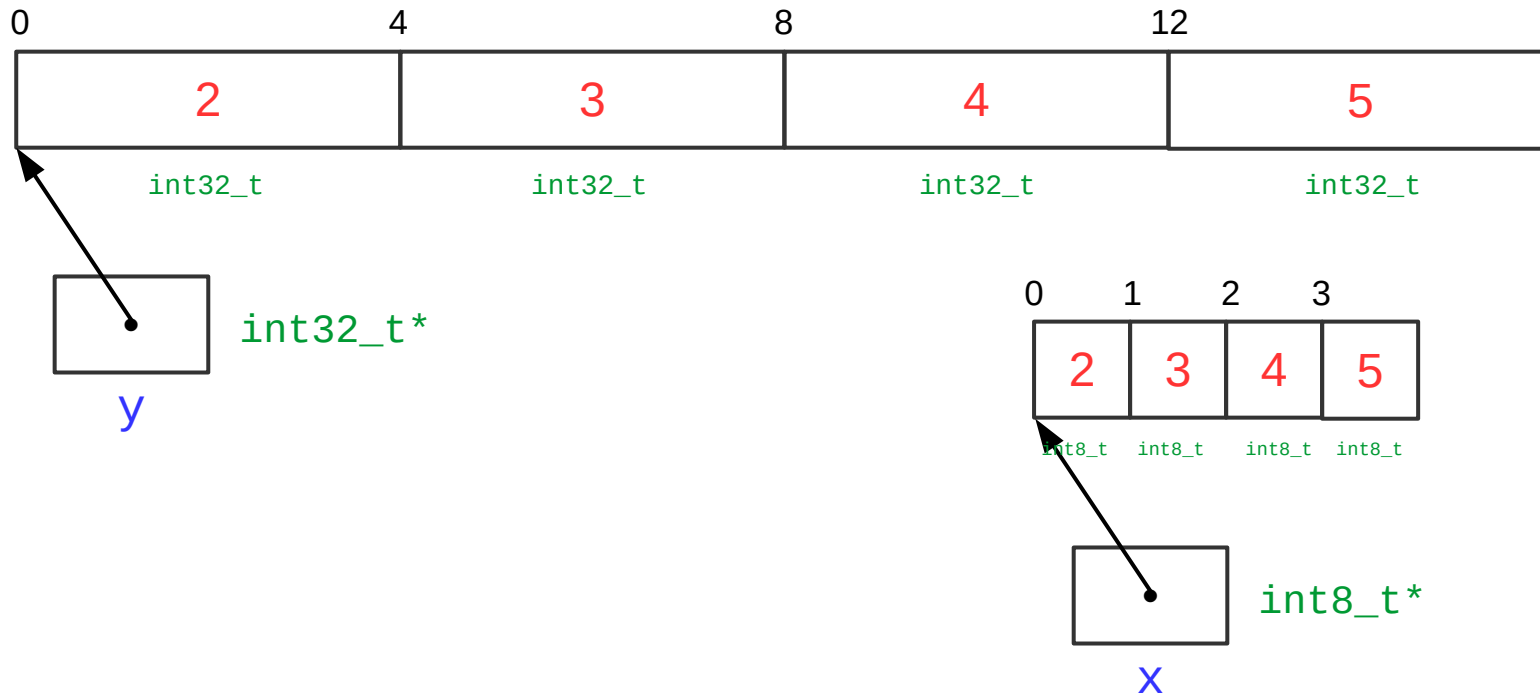

Side note: you can do arithmetic with pointers!

```
*y  ≡ y[0]           *(y+1) ≡ y[1]
```

# Arrays and Pointers

- Pointer types are important!
  - If  $x$  is an `int8_t*`,  $x[3]$  accesses element at byte offset  $3 \times 1 = 3$
  - If  $y$  is an `int32_t*`,  $y[3]$  accesses element at byte offset  $3 \times 4 = 12$

# Pointers

```
int x = 1;  
int y[4] = {2, 3, 4, 5};  
int *p = &x;  
*p = 6;  
p = y;  
*p = 7;
```

**What are the values of x and y  
at the end?**

# Pointers

```
int x = 1;
```

```
int y[4] = {2, 3, 4, 5};
```

```
int *p = &x;
```

```
*p = 6;
```

```
p = y;
```

```
*p = 7;
```

# Pointers

```
int x = 1;
```

```
int y[4] = {2, 3, 4, 5};
```

```
int *p = &x;
```

```
*p = 6;
```

```
p = y;
```

```
*p = 7;
```

# Pointers

```
int x = 1;
```

```
int y[4] = {2, 3, 4, 5};
```

```
int *p = &x;
```

```
*p = 6;
```

```
p = y;
```

```
*p = 7;
```

# Pointers

```
int x = 1;
```

```
int y[4] = {2, 3, 4, 5};
```

```
int *p = &x;
```

```
*p = 6;
```

```
p = y;
```

```
*p = 7;
```

# Pointers

```
int x = 1;
```

```
int y[4] = {2, 3, 4, 5};
```

```
int *p = &x;
```

```
*p = 6;
```

```
p = y;
```

```
*p = 7;
```

# Pointers

```
int x = 1;
```

```
int y[4] = {2, 3, 4, 5};
```

```
int *p = &x;
```

```
*p = 6;
```

```
p = y;
```

```
*p = 7;
```

# Pointers

```
int x = 1;  
int y[4] = {2, 3, 4, 5};  
int *p = &x;  
*p = 6;  
p = y;  
*p = 7;
```

What about this?

```
p++;  
*p = 9;
```

# Arrays and Pointers

- The same is (roughly) true for C "strings" (arrays of chars)

```
char text[] = "hello"; // read-write  
char *text = "hello"; // read-only
```

# C Strings

- C strings are a sequence of **ASCII** chars **terminated with null char** (`'\0'`)
  - Declare and initialize (static/stack, no explicit size needed):
    - `char *name = "John Smith";`
    - `char name[] = "John Smith";`
  - Declare only (static/stack, size needed):
    - `char name[11];`
  - Declare only (heap, size needed):
    - `char *name = (char*) malloc (sizeof(char) * 11);`
- Useful functions (need to `#include <string.h>`)
  - Find length: `strlen`
  - Copy string or convert / format data into string: `snprintf`
  - Convert to long / float: `strtol` / `strtof`
  - Compare strings: `strncmp`
  - Search for substring: `strstr`

# Information = Bits + Context

## ASCII TABLE

Decimal	Hex	Char	Decimal	Hex	Char	Decimal	Hex	Char	Decimal	Hex	Char
0	0	[NULL]	32	20	[SPACE]	64	40	@	96	60	`

# Copying strings

- In Java: `dest = str1 + str2; // copy strings`
  - What does this code do in C?

- Need to copy all characters from one string to another
  - First for `str1` and then for `str2`

# Copying strings

- Old solution: `strcpy`

- Basically:

```
void strcpy (char *dest, char *src)
{
    for (int i = 0; src[i] != '\0'; i++) {
        dest[i] = src[i];
    }
}
```

- What happens if `src` isn't null-terminated?

**OUT OF BOUNDS!!!**

# Copying strings

- Using `strcpy` is now considered **unsafe**
  - You are **not permitted** to use it in CS 261
- Solution: specify a maximum length that is safe to copy
  - This is usually the allocated length of the destination
- Older alternative: `strncpy`
  - Requires a maximum length
  - However, it does not guarantee the result is null-terminated
- Newer alternative: `strcpy_s`
  - However, it is not in the C99 standard
- **Better alternative: `snprintf`**
  - Safe, C99-standard, and more powerful than the other two

# Output and string conversion

- `printf` and `snprintf` are conceptually similar
  - The former prints to standard out
  - The latter "prints" to a string (character array)
  - The latter can also copy strings and convert to strings
    - `snprintf(dest_str, max_size, "%s", src_str); // copy string`
    - `snprintf(dest_str, max_size, "%d", int_var); // int -> string`
    - `snprintf(dest_str, max_size, "%f", float_var); // float -> string`

```
int printf (                                char *format, ...)
```

```
int snprintf (char *buffer, int bufsize, char *format, ...)
```

↑  
destination string;  
must be at least  
"bufsize" bytes

↑  
maximum  
size

# Question

- How do we declare an array of strings?

# Arrays of arrays

- Array of string (char\*) pointers
  - Two (roughly) equivalent syntax choices
    - `char *name[];`
    - `char **name;`
  - Must allocate/initialize each sub-array separately
- Command-line parameters
  - `int main (int argc, char *argv[])`
  - Example: `./program -a myfile.txt`
    - `argc = 3`
    - `argv[0] = "./program"`
    - `argv[1] = "-a"`
    - `argv[2] = "myfile.txt"`

# Modified "Hello, World"

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>

#define STR_LEN 8

int main(int argc, char **argv)
{
    // check parameters
    if (argc != 3) {
        fprintf(stderr, "Usage: ./hello2 <fname> <lname>\n");
        exit(EXIT_FAILURE);
    }

    // convert name to "First L." format
    char fullname[STR_LEN];
    snprintf(fullname, STR_LEN, "%s %c.", argv[1], argv[2][0]);

    // output new full name
    printf("Hello, %s!\n", fullname);

    return EXIT_SUCCESS;
}
```
