

CS 432

Fall 2023

Mike Lam, Professor

(AN UNMATCHED LEFT PARENTHESIS
CREATES AN UNRESOLVED TENSION
THAT WILL STAY WITH YOU ALL DAY.

<https://xkcd.com/859/>

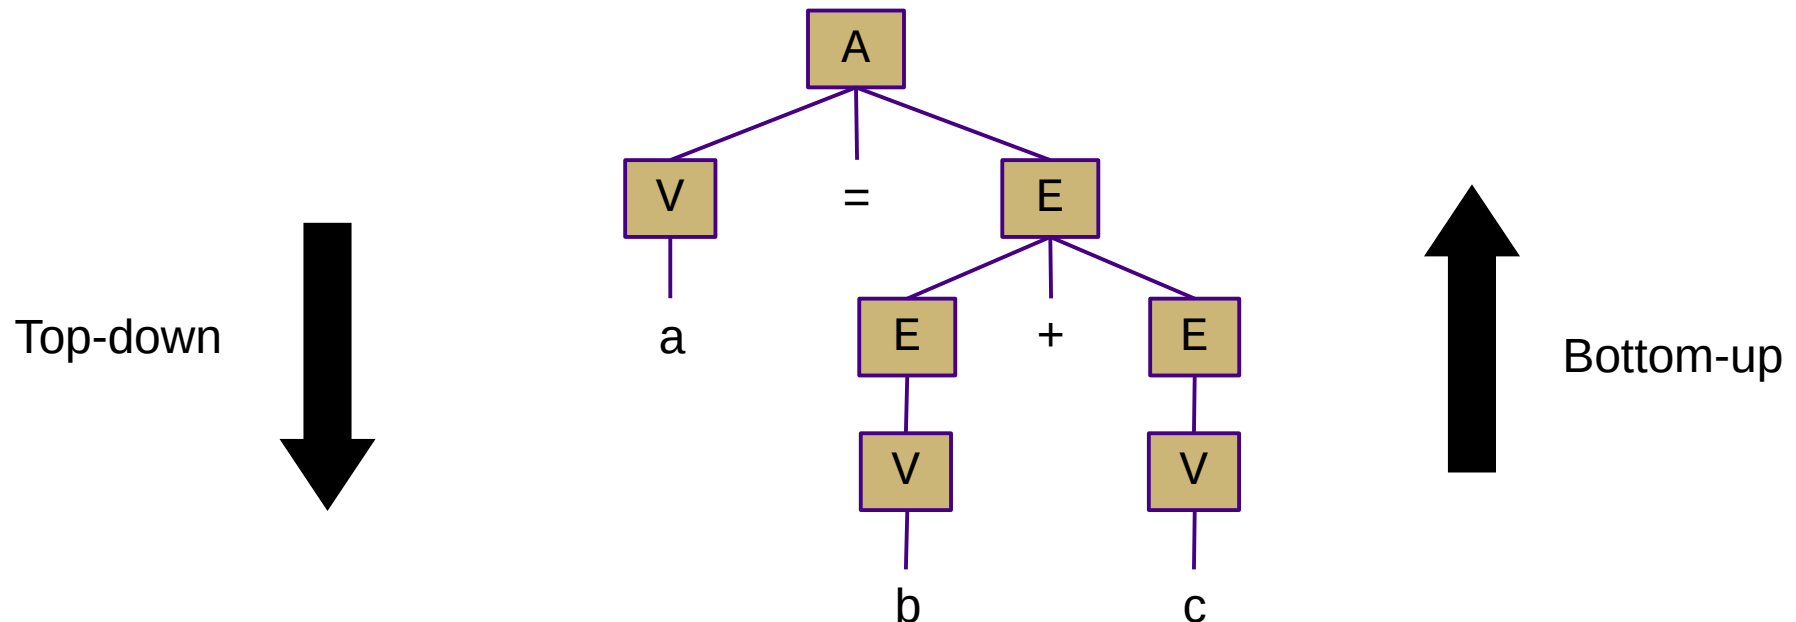

Bottom-Up (LR) Parsing

Compilation

Overview

- Two general parsing approaches
 - Top-down: begin with start symbol (root of parse tree), and gradually expand non-terminals
 - Bottom-up: begin with terminals (leaves of parse tree), and gradually connect using non-terminals

Shift-Reduce Parsing

- Top-down (LL) parsers
 - Left-to-right scan, Leftmost derivation
 - Recursive routines, one per non-terminal (*recursive descent*)
 - Implicit stack (system call stack)
 - Requires more restrictive grammars
 - Simpler to understand and possible to hand-code
- Bottom-up (LR) parsers
 - Left-to-right scan, (reverse) Rightmost derivation
 - "Shift"/push terminals and non-terminals onto a stack
 - "Reduce"/pop to replace *handles* with non-terminals
 - Less restrictive grammars
 - Harder to understand and nearly always auto-generated; very efficient!

Shift-Reduce Parsing

- - shift 'a'
- a
 - reduce ($V \rightarrow a$)
- V
 - shift '='
- V =
 - shift 'b'
- V = b
 - reduce ($V \rightarrow b$)
- V = V
 - reduce ($E \rightarrow V$)
- V = E
 - shift '+'
- V = E +
 - shift 'c'
- V = E + c
 - reduce ($V \rightarrow c$)
- V = E + V
 - reduce ($E \rightarrow E + V$)
- V = E
 - reduce ($A \rightarrow V = E$)
- A
 - accept

(handles are underlined)

shift = push, reduce = popN

$$\begin{array}{l}
 A \rightarrow V = E \\
 E \rightarrow E + V \\
 \quad | \quad V \\
 V \rightarrow a \quad | \quad b \quad | \quad c
 \end{array}$$

“a = b + c”

LR Parsing

- **LR(1)** grammars and parsers
 - **Left-to-right** scan of the input string
 - **Rightmost** derivation
 - **1 symbol** of lookahead
 - Less restricted form of context-free grammar
 - Support for most language features
 - Efficient parsing

**Context-Free
Hierarchy**

LR Parser Variants

- LR(k) – multiple lookaheads (not necessary)
- LR(1) – single lookahead (*EAC covers this!*)
 - Very general and very powerful
 - Lots of item sets; tedious to construct by hand
 - Overkill for most practical languages
- LALR(1) – special case of LR(1) that merges some states
 - Less powerful, but easier to manage
- **SLR(1)** – special case of LR(1) w/o explicit lookahead (*Dragon book covers this!*)
 - Uses **FOLLOW** sets to disambiguate
 - Even less powerful, but much easier to understand
 - Slightly counterintuitive: all LR(1) languages have SLR(1) grammars
 - So SLR(1) is sufficiently general for our purposes
 - Use LR(0) item sets and generate SLR(1) ACTION/GOTO tables
- LR(0) – no lookahead
 - Severely restricted; most "interesting" grammars aren't LR(0)

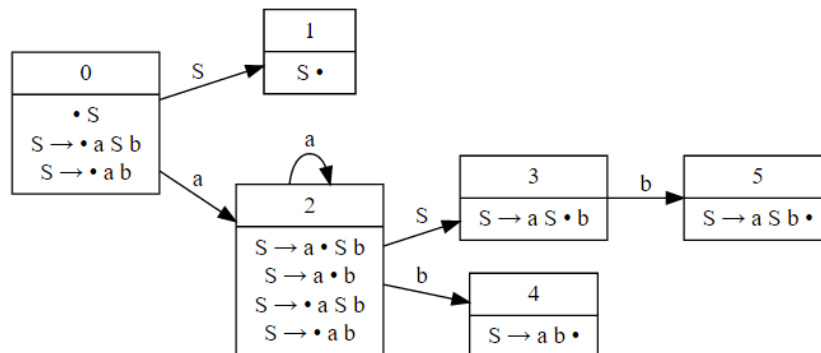

LR Parsing

- Creating an LR parser (**pushdown automaton**)
 - Build item sets from grammar productions
 - An **item** uses a dot (•) to represent parser status: "A → a • S b"
 - Dots on the left end: "possibilities"
 - Dots in the middle: "partially-complete"
 - Dots on the right end: "complete"
 - **Item sets** represent multiple parser states (build by taking closure)
 - Similar to NFA state collections in subset construction
 - Build **ACTION** / **GOTO** tables
 - Encodes stack and transition decisions (like δ in FA)
 - **ACTION**(state, terminal) = { *shift/push*, *reduce/pop*, *accept* }
 - **GOTO**(state, non-terminal) = state

LR(0) Item Sets

- LR(0) item sets and automaton

- Start with an item representing “ $\bullet S$ ” or “ $S' \rightarrow \bullet S$ ”
 - The latter is an **augmented** grammar
 - The Dragon book uses it; the online tool doesn't
- Take the **closure** to add more states if the dot lies immediately to the left of a non-terminal
 - (**Non-kernel** items, denoted here in blue)
- Form new sets by “moving the dot” (and take the closure)
- Convert to finite automaton for recognizing handles by adding transitions
 - Each set becomes a state
 - “Moving the dot” = state transition + stack push

$$S \rightarrow a S b$$

$$\quad | \quad a b$$

$$I_0: \quad \bullet S$$

$$S \rightarrow \bullet a S b$$

$$S \rightarrow \bullet a b$$

$$I_1: \quad S \bullet$$

$$I_2: \quad S \rightarrow a \bullet S b$$

$$S \rightarrow a \bullet b$$

$$S \rightarrow \bullet a S b$$

$$S \rightarrow \bullet a b$$

$$I_3: \quad S \rightarrow a S \bullet b$$

$$I_4: \quad S \rightarrow a b \bullet$$

$$I_5: \quad S \rightarrow a S b \bullet$$

SLR(1) Tables

- Create **ACTION** and **GOTO** tables
 - For each item set i
 - If an item matches $A \rightarrow \beta \cdot c \gamma$
 - **ACTION**(i, c) = "shift" to corresponding item set ("move the dot")
 - If an item matches $A \rightarrow \beta \cdot$
 - **ACTION**(i, x) = "reduce $A \rightarrow \beta$ " for all x in **FOLLOW**(A) ("backtrack in FA")
 - If an item matches $A \rightarrow \beta \cdot B \gamma$
 - **GOTO**(i, B) = corresponding item set ("move the dot")
 - **ACTION**($\{S \cdot\}, \$$) = "accept"
 - Any empty **ACTION** entry = "error" (usually left blank)

SLR(1) Parsing

- **Push** state 0 onto the stack
- Repeat until next action is accept or error:
 - Look up next action in **ACTION** table
 - Row is the current state (top of stack)
 - Column is the next input (terminal or \$)
 - If action is $\text{shift}(s)$:
 - **Push** state s onto stack
 - Consume one token from input
 - If action is $\text{reduce}(A \rightarrow \beta)$:
 - **Pop** one state for each terminal or non-terminal in β
 - Look up next state in **GOTO** table and **push** it onto the stack
 - Row is the current state (top of stack, *after* popping β)
 - Column is A (newly-reduced non-terminal)

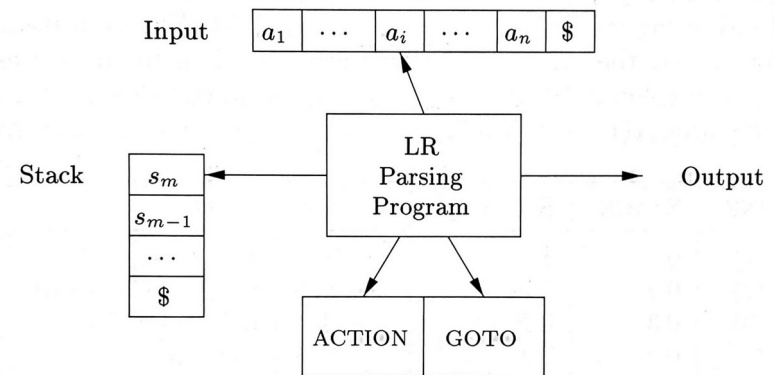

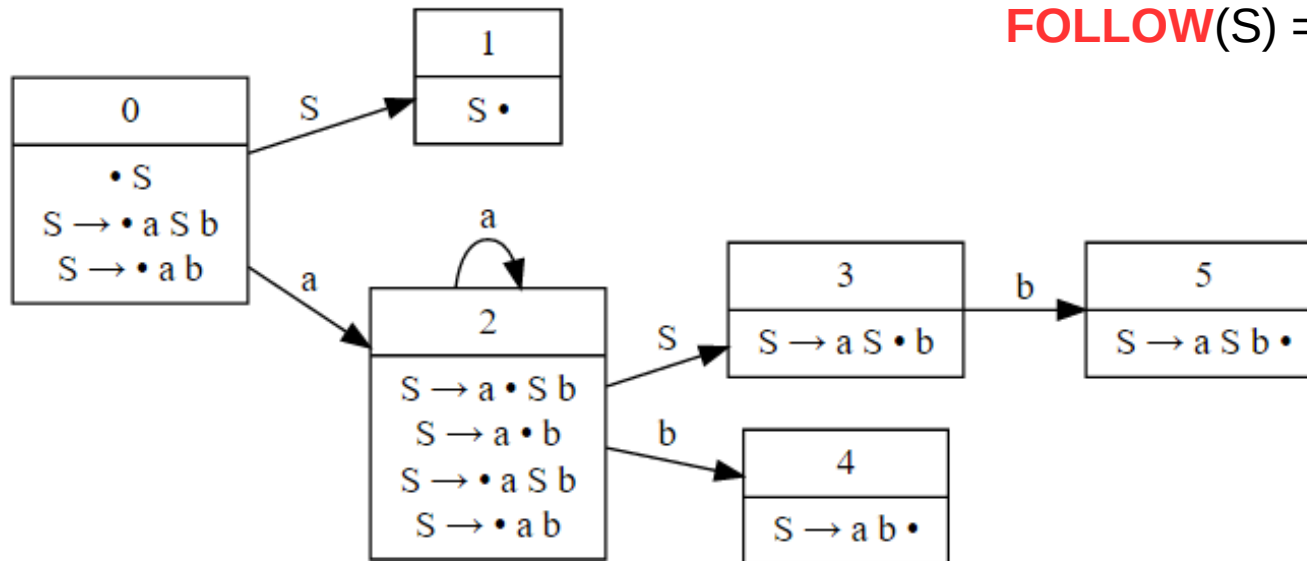

Figure 4.35: Model of an LR parser

Example

$$S \rightarrow a S b$$

$$| a b$$

| State | ACTION | | | GOTO |
|-------|----------|---------------------------------|---------------------------------|------|
| | a | b | $\$$ | |
| 0 | shift(2) | | | 1 |
| 1 | | | accept | |
| 2 | shift(2) | shift(4) | | 3 |
| 3 | | shift(5) | | |
| 4 | | reduce($S \rightarrow a b$) | reduce($S \rightarrow a b$) | |
| 5 | | reduce($S \rightarrow a S b$) | reduce($S \rightarrow a S b$) | |

FOLLOW(S) = { b , $\$$ }

Example

$$S \rightarrow a S b$$

$$| a b$$

| State | ACTION | | | GOTO |
|-------|----------|---------------------------------|---------------------------------|------|
| | a | b | \$ | |
| 0 | shift(2) | | | 1 |
| 1 | | | accept | |
| 2 | shift(2) | shift(4) | | 3 |
| 3 | | shift(5) | | |
| 4 | | reduce($S \rightarrow a b$) | reduce($S \rightarrow a b$) | |
| 5 | | reduce($S \rightarrow a S b$) | reduce($S \rightarrow a S b$) | |

Parsing for "a a b b":

(Dragon Book version)

Stack

Symbols

Input

Action

\$ 0

\$

a a b b \$

shift(2)

\$ 0 2

\$ a

a b b \$

shift(2)

\$ 0 2 2

\$ a a

b b \$

shift(4)

\$ 0 2 2 4

\$ a a b

b \$

reduce($S \rightarrow a b$)

\$ 0 2 3

\$ a S

b \$

shift(5)

\$ 0 2 3 5

\$ a S b

\$

reduce($S \rightarrow a S b$)

\$ 0 1

\$ S

\$

accept

Example

$$S \rightarrow a S b$$

$$| a b$$

| State | ACTION | | | GOTO |
|-------|----------|---------------------------------|---------------------------------|------|
| | a | b | \$ | S |
| 0 | shift(2) | | | 1 |
| 1 | | | accept | |
| 2 | shift(2) | shift(4) | | 3 |
| 3 | | shift(5) | | |
| 4 | | reduce($S \rightarrow a b$) | reduce($S \rightarrow a b$) | |
| 5 | | reduce($S \rightarrow a S b$) | reduce($S \rightarrow a S b$) | |

Parsing for "a a b b":

(cleaner version w/ goto)

| <u>Stack</u> | <u>Input</u> | <u>Action</u> | <u>Goto</u> |
|----------------|-------------------|---------------------------------|-------------|
| <u>0</u> | <u>a</u> a b b \$ | shift(2) | - |
| 0 <u>2</u> | <u>a</u> b b \$ | shift(2) | - |
| 0 2 <u>2</u> | <u>b</u> b \$ | shift(4) | - |
| 0 2 2 <u>4</u> | <u>b</u> \$ | reduce($S \rightarrow a b$) | 3 |
| 0 2 <u>3</u> | <u>b</u> \$ | shift(5) | - |
| 0 2 3 <u>5</u> | <u>\$</u> | reduce($S \rightarrow a S b$) | 1 |
| 0 <u>1</u> | <u>\$</u> | accept | |

LR Conflicts

- Shift/reduce
 - Can be resolved by always shifting or by grammar modification
- Reduce/reduce
 - Requires grammar modification to fix

$A \rightarrow V = E$

$E \rightarrow E + V$

$E \rightarrow V$

$V \rightarrow a \mid b \mid c$

Shift/reduce conflict in LR(0)

$A \rightarrow x A x$

$A \rightarrow$

Shift/reduce conflict (all LR)

$A \rightarrow B \mid C$

$B \rightarrow x$

$C \rightarrow x$

Reduce/reduce conflict (all LR)

Observation: none of these languages are LL(1) either!
