# CS 470 Spring 2024

Mike Lam, Professor

xXxMPI\_360\_NOSYNCxXx

### Naming

#### Content taken from the following:

"Distributed Systems: Principles and Paradigms" by Andrew S. Tanenbaum and Maarten Van Steen (Chapter 4) Various online sources (including openclipart.org)

### **Naming**

- "What's in a name?"
  - "That which we call a .com by any other TLD would load just as quickly."

"There are only two hard things in Computer Science: cache invalidation and naming things."

- Phil Karlton (Netscape)

### Trivia

- What is Netscape?
  - A. A web browser
  - B. A web directory
  - C. An internet service provider
  - D. A brand name
  - E. All of the above
  - F. None of the above

### Addressing

- Concept of an entity and its name vs. its address
- Some names are true identifiers
  - Each identifier refers to at most one entity
  - Each entity is referred to by at most one identifier
  - Identifiers are never re-used at another time
- Name-to-address binding
  - Name space: domain of all possible names
  - Static vs. dynamic
  - Central vs. decentralized
    - Name server: central host responsible for maintaining bindings

## Addressing

- Which of the following is the most decentralized name binding?
  - A. Mailing addresses
  - B. Discord server nicknames
  - C. Subreddits
  - D. Human nicknames
  - E. Xbox gamertags

## Naming schemes

```

                           nano
38b22b10
                           vim
                         lib/
```

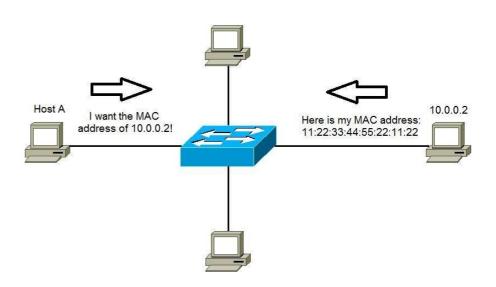

Flat

Structured

Attribute-based

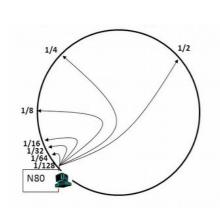

## Flat naming

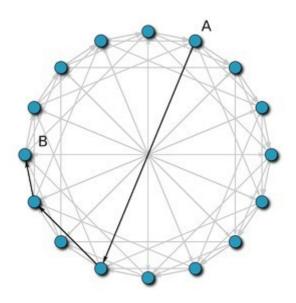

- Identifiers contain no location information
- Various lookup approaches
  - Broadcast / multicast
  - Forwarding pointers
  - Proximity routing
- Examples: ARP, Chord

#### Distributed hash tables

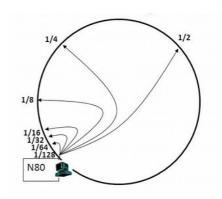

- Chord uses an m-bit identifier space and modulo arithmetic
  - Key k is stored at the node with the smallest id  $\geq$  k
- Each node maintains a finger table of forward shortcuts
- To look up k, repeatedly follow lookups in finger table
  - Goal: halve distance to destination every hop

### Addressing

- Which of the following is the maximum size of the finger table for a 256-node Chord network?
  - A. 0
  - B. 1
  - C. 8
  - D. 32
  - E. 128

### Structured naming

- Root vs. interior vs. leaf nodes
- Absolute vs. relative names
  - Global vs. local names
- Iterative vs. recursive resolution
- Linking and aliasing
  - Hard vs. soft (symbolic) links
- Mounting and mount points

# **Naming**

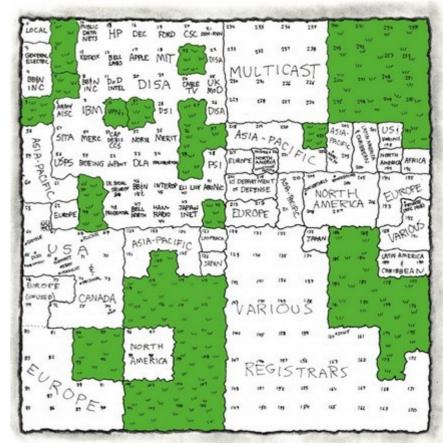

- Which of the following is an example of a structured (as opposed to flat) name binding?
  - A. Mailing addresses
  - B. Discord server nicknames
  - C. Subreddits
  - D. Human nicknames
  - E. Xbox gamertags

- IPv4: 32 bits four octets w/ CIDR notation (/8, /16, etc.)
  - Classful addressing: Class A, Class B, Class C
  - IETF and IANA allocate addresses (32 bits 4 billion total addresses)
  - Published in 1981; now nearly exhausted
- Notable networks
  - Private (10.0.0.0/8)
  - Loopback (127.0.0.0/8)
  - JMU (134.126.0.0/16)
  - Private (192.168.0.0/16)

An IPv4 address (dotted-decimal notation)

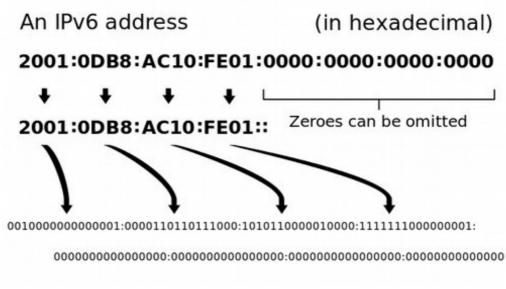

from https://en.wikipedia.org/wiki/IPv4

- What is the total number of addresses in IPv4?
  - A. 2<sup>8</sup>
  - B. 2<sup>16</sup>
  - C. 2<sup>32</sup>
  - D. 2<sup>64</sup>
  - E. 2<sup>128</sup>

- IPv6 published in 1998
  - 128 bits 3.4×10<sup>38</sup> total addresses
  - Eight groups of 16 bits (4 hex chars)
  - 64-bit routing prefix, 64-bit host/interface identifier

- What is the total number of addresses in IPv6?
  - A. 28
  - B. 2<sup>16</sup>
  - C. 2<sup>32</sup>
  - D. 2<sup>64</sup>
  - E. 2<sup>128</sup>

#### IPv4 vs. IPv6

- The IPv6 name space is far larger than you think!
  - In fact, there is NO WAY to draw the two address spaces to scale.
     If IPv4 were a 1.6-inch square, IPv6 would be a square the size of the solar system!
  - $2^{128} \approx 10^{38}$  » the number of drops of water in all the world's oceans (10<sup>25</sup>) or the number of stars in the observable universe (10<sup>23</sup>)
  - "If we had been assigning IPv6 addresses at a rate of 1 billion per second since the earth was formed, we would have by now used up less than one trillionth of the address space."
  - "We could assign an IPv6 address to every atom on the surface of the earth – and have enough addresses left over for another hundred earths."

- http://www.tcpipguide.com/free/t\_IPv6AddressSizeandAddressSpace-2.htm
- http://www.brucebnews.com/2010/10/ipv6-and-really-large-numbers/

### Why haven't we transitioned?

#### Advantages

- Solves IP naming problem pseudo-permanently
- Deals with explosion of Internet of Things (IoT) devices requiring an address
- Increasing cost to acquire IPv4 addresses

#### Obstacles

- Network Address Translation (NAT) allows multiple hosts to use a single public IP address
- IPv4 blocks have become more "fluid"
- Lack of expertise managing multi-protocol networks

### Attribute-based naming

- Human-friendly resource identifiers
- Storage of (key, value) pairs
- Often implemented with distributed hash tables
  - Centralized vs. decentralized lookups
  - You implemented this in P3!
- Semantic overlay networks
  - Nodes maintain explicit links to "semantically proximate" nodes
  - Most useful in distributed peer-to-peer networks
  - Exploit small-world effect

### Attribute-based naming

- Which of the following is the best example of a semantic overlay network?
  - A. Mailing addresses
  - B. Discord server nicknames
  - C. Subreddits
  - D. Human nicknames
  - E. Xbox gamertags
