

CS139 – PA3 Intro

PA3 – Some New Features

- Multiple classes
 - Instantiating objects
 - Unit Testing
 - Class-level constants
-
- Let's look at a similar application “All-Fours”.
 - Betting game where players bet that three dice will all land on 4.

All-Fours Design

- Divide the application into three classes:

- **Dice.java**: This class represents three rolled dice. Handles the logic of random rolling and provides methods for accessing the results.
- **AllFours.java**: Contains the betting logic. Code for recognizing winning rolls and calculating payouts.
- **Driver.java**: Contains the code for user interaction.
- Why not put all of the Java code into one file?????

Design Goal: Maximize *Cohesion*

- **Cohesion** - each Java class handles a single well-defined problem.
- Cohesion leads to modular, re-usable code.
- E.g. the Dice class may be re-used in some other game that involves rolling dice.

Design Goal: Minimize *Coupling*

- **Coupling** – When one class depends on another class to function.
- Minimizing coupling makes the individual classes easier to code.
- The arrows illustrate dependencies:

- We can program and test the Dice class without ever looking at the other two.

Instantiating Objects

- We've seen code like this:

```
Scanner scan;  
scan = new Scanner(System.in);
```

- Terminology:
 - Scanner is a **class**
 - “**new**” is a Java keyword for **instantiating** objects of a class
 - An **object** ties together data and methods
 - “Scanner” is a special method called a **constructor** that does the work of setting up the new object.
 - The scan variable will contain a **reference** to the new Scanner object

Instantiating Dice

```
int count;  
count = 7;  
  
double weight;  
weight = 3.5;  
  
String name;  
name = "Bob Hope";  
  
Scanner input;  
input = new Scanner(System.in);  
  
Dice roll;  
roll = new Dice(3, 5, 5);
```

Stack Memory

count

weight

name

input

roll

Heap Memory

"Bob Hope"

(Complicated
Internal State)

3 | 5 | 5

Instantiating Dice

```
int count;  
count = 7;  
  
double weight;  
weight = 3.5;  
  
String name;  
name = "Bob Hope";  
  
Scanner input;  
input = new Scanner(System.in);  
  
Dice roll;  
roll = new Dice(3, 5, 5);
```

Stack Memory

count

weight

name

input

roll

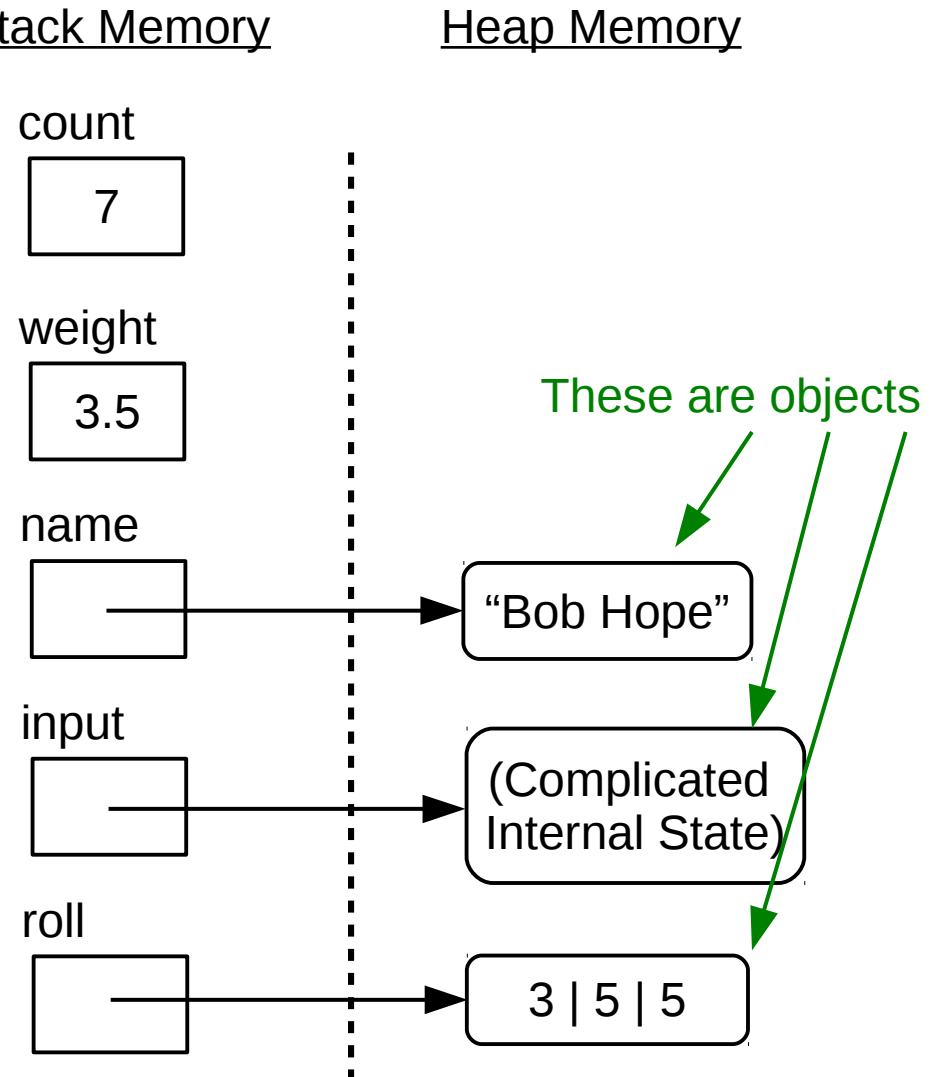

Heap Memory

These are objects

"Bob Hope"

(Complicated
Internal State)

3 | 5 | 5

Instantiating Dice

```
int count;  
count = 7;  
  
double weight;  
weight = 3.5;  
  
String name;  
name = "Bob Hope";  
  
Scanner input;  
input = new Scanner(System.in);  
  
Dice roll;  
roll = new Dice(3, 5, 5);
```

Stack Memory

Heap Memory

count

weight

name

input

roll

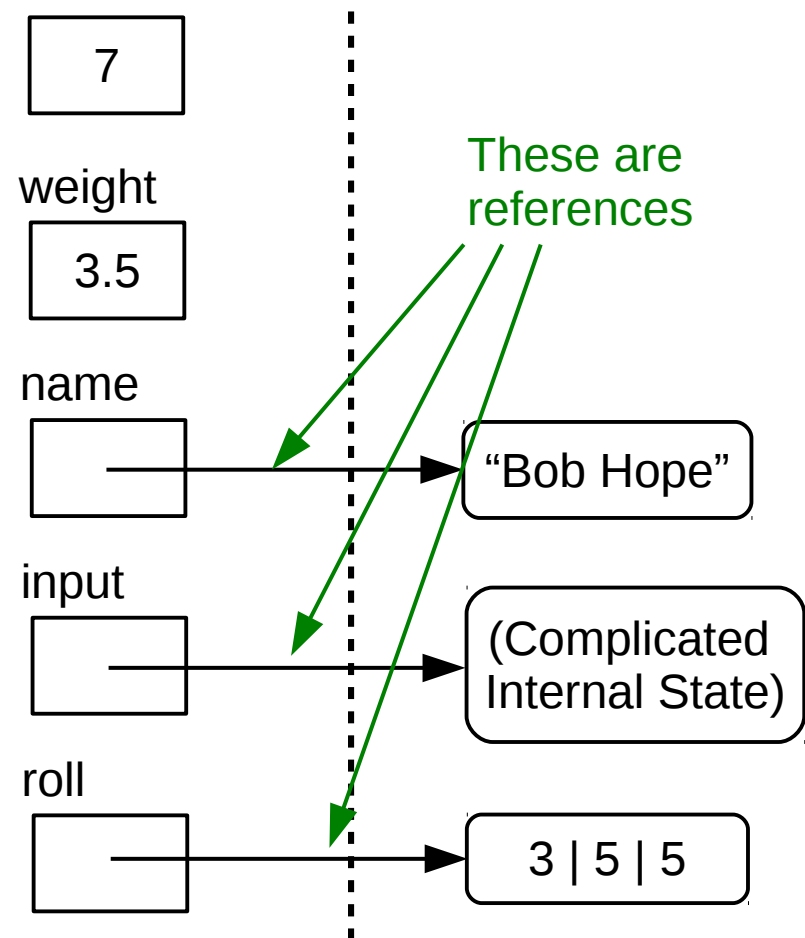

These are references

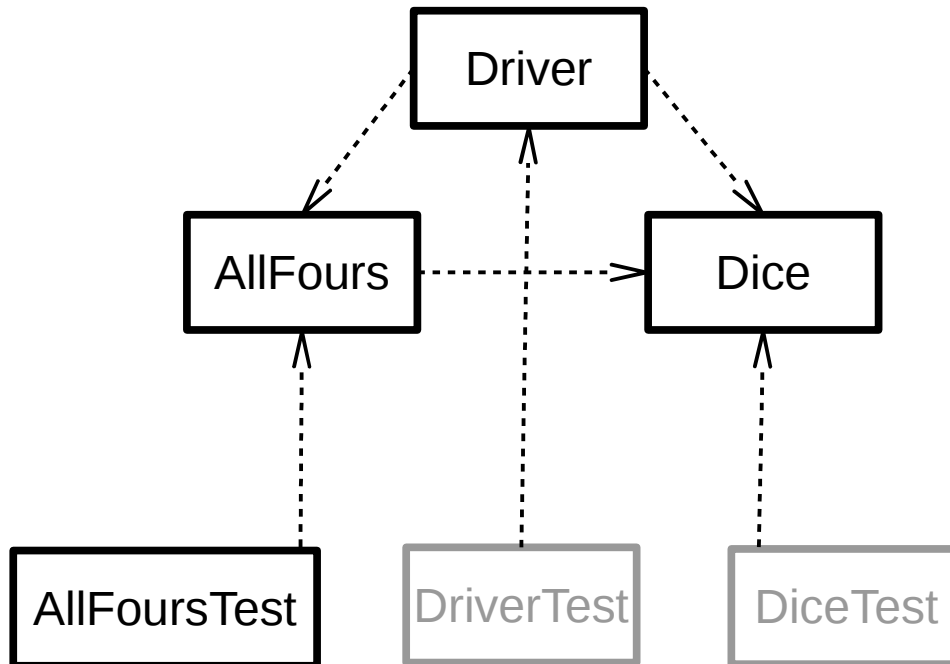

"Bob Hope"

(Complicated Internal State)

3 | 5 | 5

Unit Testing

Finished Application

- `AllFours.java`
- `AllFoursTest.java`
- `Dice.java`
- `Driver.java`
