Linked Structures

Chapter 6

 $^{\circ}$ 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise.

Linked Structure

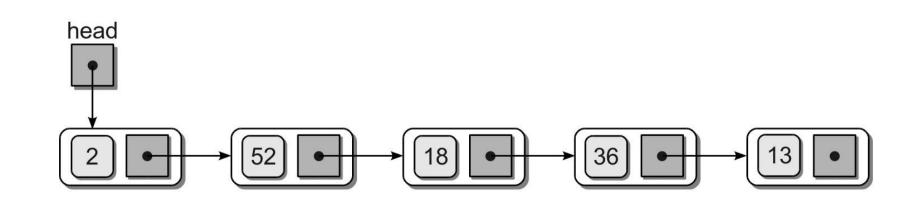

- Constructed using a collection of objects called nodes.
- Each node contains data and at least one reference or **link** to another node.
- Linked list a linked structure in which the nodes are linked together in linear order.

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise.

Linked List

- Terms:
 - **head** first node in the list.
 - **tail** last node in the list; link field has a null reference.

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise.

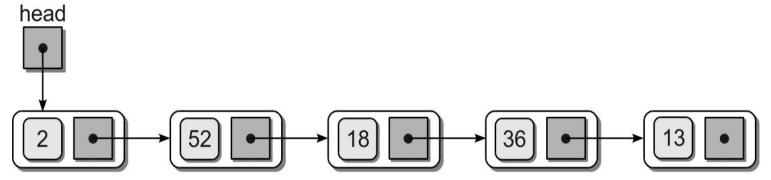

Node Definition

• The nodes are constructed from a simple storage class:

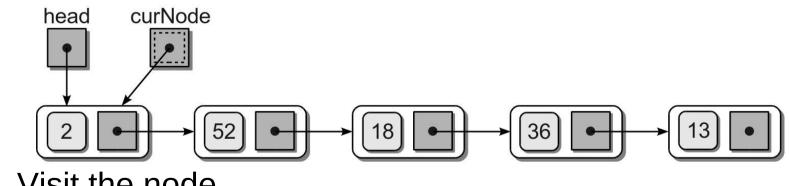

class _ListNode: def __init__(self, data): self.data = data self.next = None

Traversing the Nodes

• We can traverse the nodes using a temporary external reference variable.

• Initialize a temporary reference to the head node.

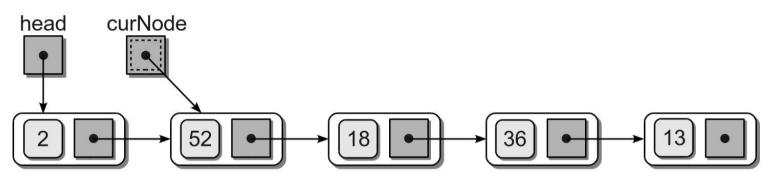

• Visit the node.

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise.

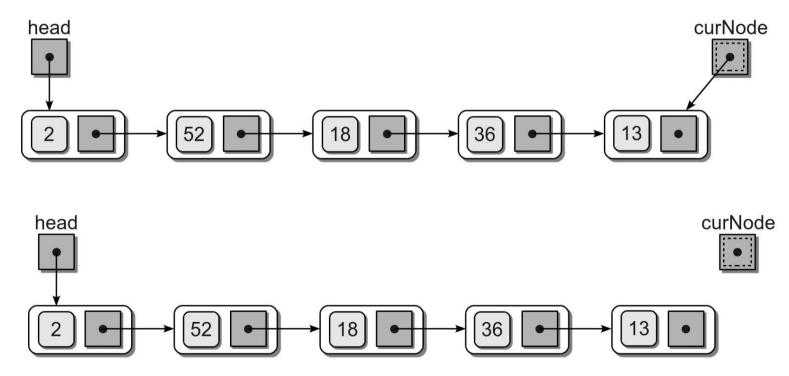

Traversing the Nodes

• Advance the temporary reference to the next node using the link field and visit that node.

Traversing the Nodes

• Repeat the process until the reference falls off the end of the list.

Searching

• We can perform a linear search to determine if the list contains a specific data item.

Prepending Nodes

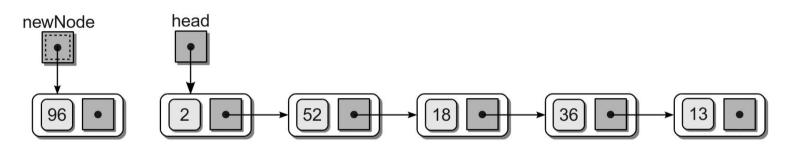

- When working with an unsorted linked list, new values can be inserted at any point.
- We can prepend new items with little effort.
- **Example:** add value 96 to the sample list.

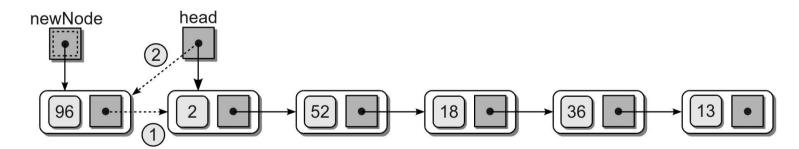

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise.

Prepending Nodes

• Create a new node for the new item.

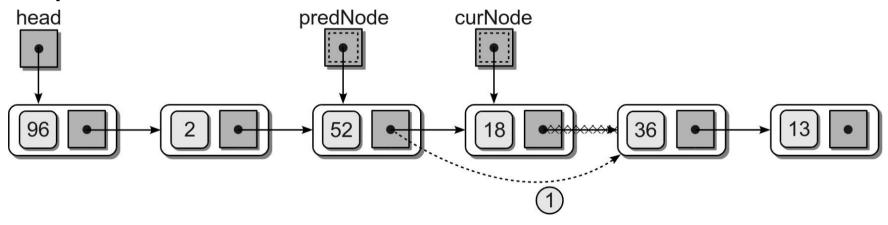

• Connect the new node to the list.

Removing Nodes

 Removing a node from the middle of the list requires a second external reference.

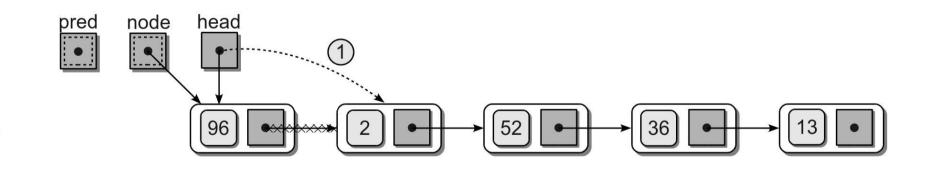

Resulting list.

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise.

Removing Nodes

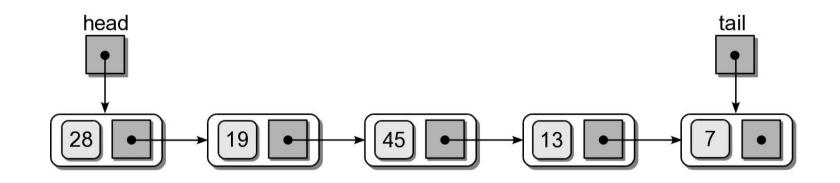

- Removing the first node is a special case.
- The head reference must be reposition to reference the next node in the list.

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise.

Using a Tail Reference

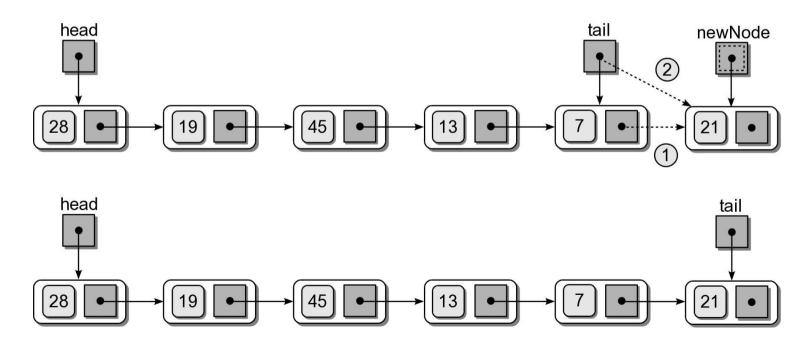

- Some applications require items be appended to the end of the linked list.
 - **tail reference** a second external reference indicating the tail or last node in the list.

Chapter 5: Searching and Sorting

Appending Nodes

- Must manage the tail reference as nodes are added/removed.
 - **Example**: append 21 to the list.

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise.

Chapter 5: Searching and Sorting4

Appending Nodes

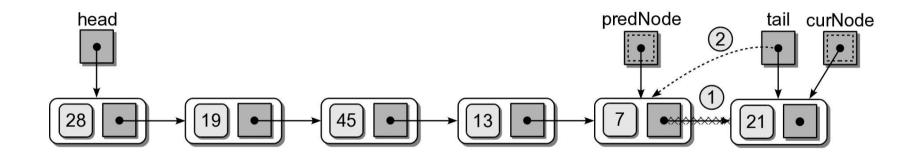

• Given the head and tail reference, we can add an item to a linked list.

```
newNode = ListNode( item )
if self._head is None :
    self._head = newNode
    self._tail = newNode
else :
    self._tail.next = newNode
    self._tail = newNode
```

What is the time complexity to append a node to a linked list, if no tail reference is used?

Removing Nodes

• If the tail node is removed, the tail reference has to be adjusted.

Chapter 5: Searching and Sorting

The Sorted Linked List

• The items in a linked list can be maintained in sorted order.

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise.

Chapter 5: Searching and Sorting

Sorted List: Searching

• Searching a sorted list is similar to that of an unsorted list.

def sortedSearch(head, target):
 curNode = head

```
# Stop early when a larger value is encountered.
while curNode is not None and \
    target <= curNode.data :
    if curNode.data == target :
        return True
    else :
        curNode = node.next</pre>
```

```
return False
```

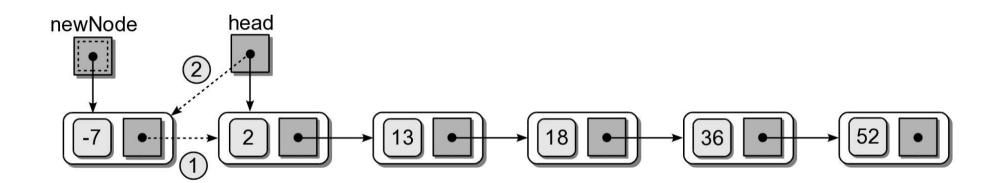

Sorted List: Insert

- Adding a new node to a sorted list requires locating the correct position within the list.
 - Locating the position is similar to the removal operation.
 - Use a second temporary reference for the predecessor.
- There are 3 possible cases.
 - front
 - middle
 - back

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise.

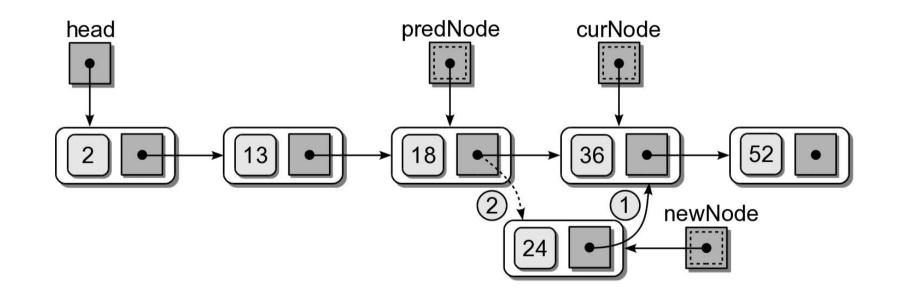

Sorted List: Insert

• (1) Insert at the front.

Sorted List: Insert

• (2) Insert in the middle.

Singly Linked List / Python List Comparison

| Operation | Linked List | Python List |
|------------------|-------------|-------------|
| append(item) | | |
| insert(0, item) | | |
| pop(0) | | |
| pop(i) | | |
| getitem(i) | | |
| setitem(i, item) | | |

• When does a Linked List make more sense than a contiguous representation?

© 2011 John Wiley & Sons, Data Structures and Algorithms Using Python, by Rance D. Necaise.

Singly Linked List / Python List Comparison

| Operation | Linked List | Python List |
|------------------|-------------|-------------|
| append(item) | O(n) | O(1)* |
| insert(0, item) | O(1) | O(n) |
| pop(0) | O(1) | O(n) |
| pop(i) | O(n) | O(n) |
| getitem(i) | O(n) | O(1) |
| setitem(i, item) | O(n) | O(1) |

- When does a Linked List make more sense than a contiguous representation?
 - * Amortized
