Computer Vision and Image Processing

- Computer Vision:
 - Working backward from an image of a scene to a physical description of the scene.
 - It's a hard/impossible problem.

Computer Vision and Image Processing

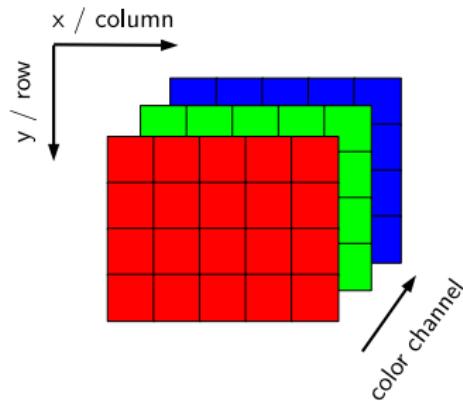

- Computer Vision:
 - Working backward from an image of a scene to a physical description of the scene.
 - It's a hard/impossible problem.
- Image processing:
 - Low level image transformations
 - blurring, sharpening, resizing etc.
 - Computer vision generally involves some initial image processing.

Image Formation

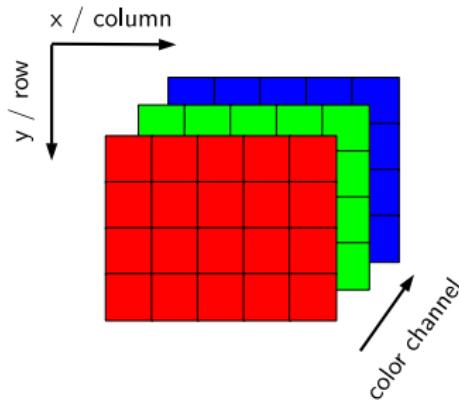

<http://commons.wikimedia.org/wiki/File:Pinhole-camera.png>

Image Representations

- Color images are often stored as a collection of RGB triples
- $(0, 0, 0)$ is black, $(255, 255, 255)$ is white.
- **RGB Color Model**

Images In Numpy

- We will work with images stored as three dimensional numpy arrays:
 - `img[row, col, color]`
- `img[0, 0, 0]` - Upper-left red value
- `img[3, 4, 2]` - Lower-right blue value
- `img[0:1, 0:2, :]` - Crop of upper left corner

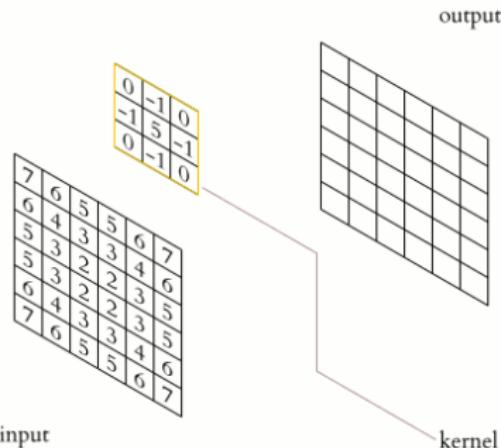

Why is Computer Vision Hard?

- Let's look at some balloons...

Image Processing - Convolutions

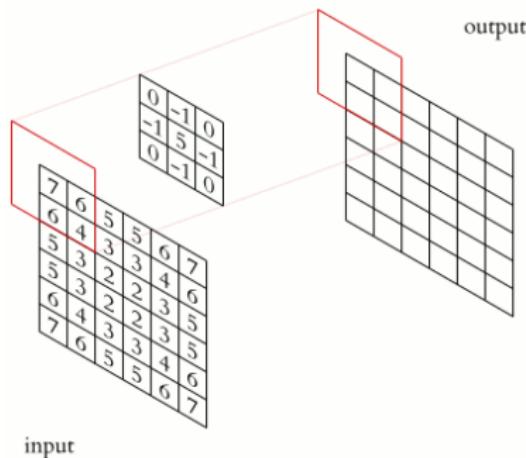

- Many low-level image processing tasks can be handled with the convolution operator:
 - **Image Convolutions**

Image Processing - Convolution Example
