

CS444 Numpy Exercises

1. Download the file `numpy_exercises.py`. At the top of the `main` method instantiate numpy arrays representing each of the following:

$$B = \begin{bmatrix} 1 & 2 & -3 \\ 3 & 4 & -1 \end{bmatrix}, A = \begin{bmatrix} 2 & -5 & 1 \\ 1 & 4 & 5 \\ 2 & -1 & 6 \end{bmatrix}, y = \begin{bmatrix} 2 \\ -4 \\ 1 \end{bmatrix}, z = \begin{bmatrix} -15 \\ -8 \\ -22 \end{bmatrix}$$

provide numpy code that calculates and prints each of the quantities below.

- BA
 - AB^T
 - Ay
 - $y^T z$ (This is the inner product, or dot product, of y and z .)
 - yz^T (This is the outer product of y and z .)
2. Complete the function `solve_for_x(A, z)` so that it matches the documentation. Test your function by un-commenting the appropriate lines in `main`. (The command for matrix inverse in numpy is `np.linalg.inv()`.)
 3. Complete the functions `print_rows` and `print_cols`. each method should use array slicing to print each row (or column) to a separate line. Test your functions by un-commenting the appropriate lines in `main`.
 4. Complete the function `squared_error(X, w, y)`. This function should return the quantity:

$$\sum_{\mathbf{x}_i \in \mathbf{X}} (\mathbf{x}_i \mathbf{w}^T - y_i)^2$$

Add code to your main to test the completed function.

5. If you have time: add a new method with the signature `squared_error_fast(X, w, y)`. This method should compute the same value as `squared_error`, but it should do so without using any loops.
